Live-to-air 3G transmission
via mobile phone networks

The Azure system is the new live-to-air 3G technology using mobile phone networks to transmit full frame, high quality, live camera feeds.

The Azure system is the first lightweight camera mounted transmitter to allow quick and efficient live-to-air transmission without the need of a satellite truck.

This revolutionary 3G technology can bond 4 carriers together, which delivers upload speeds of up to 4mbs. The Azure system uses the best compression and buffering technologies available and is specifically designed to utilise affordable international roaming data plans.

Welcome to the mobile generation of BOXX live-to-air video transmission with Azure.
